Revolutionizing Renewable Energy: Bihar's First Floating Solar Plant Sets a New Standard

## Why Bihar Needs Floating Solar Innovation Now

Bihar faces a dual challenge: 38% of households lack reliable grid connectivity while battling annual flood risks across 28% of its land. Could floating solar technology solve both energy access and land conservation issues simultaneously?

## The Groundbreaking Project Details

Spanning 5 acres of water surface in Darbhanga district, Bihar's first floating solar plant generates 2.1 MW of clean energy - enough to power 1,800 rural households. Unlike conventional solar farms consuming agricultural land, this innovative installation preserves Bihar's precious farmland while utilizing underused water reservoirs.

## Core Technical Specifications

Developed through a INR120 crore investment, the project combines advanced photovoltaic panels with corrosion-resistant floating structures. The system features:

- Tracking systems that follow sunlight with 0.1-degree precision
- Anti-algal coating extending panel lifespan by 40%
- Localized micro-inverters minimizing energy loss

## Environmental & Economic Benefits

What makes this floating solar power plant in Bihar truly transformative? Beyond energy generation, the installation reduces water evaporation by 70% compared to exposed reservoirs. Early monitoring shows 23% increase in dissolved oxygen levels beneath panels - a crucial benefit for aquatic ecosystems.

## Community Impact Metrics

The project creates direct employment for 160 villagers in maintenance and monitoring roles. Farmers now access daytime irrigation power without diesel costs, while 14 schools gain uninterrupted electricity for digital classrooms.

## India's Floating Solar Roadmap

As India targets 500 GW renewable capacity by 2030, Bihar's pilot project mirrors national ambitions. The Energy and Resources Institute (TERI) estimates India could generate 300 GW through floating photovoltaic systems - equivalent to 13% of current national demand.

## Future Expansion Potential

With 6 major river systems and 280 square kilometers of reservoirs, Bihar alone could deploy 14 GW floating

solar capacity. The state government plans 12 additional installations across flood-prone areas by 2027.

### **Q&A: Key Aspects of Bihar's Floating Solar Initiative**

**Q:** Why prioritize floating solar over traditional installations?

**A:** Land acquisition challenges and seasonal flooding make conventional solar farms impractical in Bihar's geography.

**Q:** How does this impact agricultural communities?

**A:** Preserves cultivable land while providing affordable power for irrigation pumps and processing units.

**Q:** What maintenance challenges exist for floating systems?

**A:** Specially trained local technicians perform monthly cleaning using customized watercraft, with panel tilt angles optimized for self-cleaning during monsoon season.
